TEAM PROJECT

PHPTRAVELS - Test Plan

Online Travel Booking Platform (Live Demo)

Project Overview

URL: https://phptravels.com/demo

PHPTRAVELS is a travel booking system. The live demo gives us three parts to test: the storefront that customers use, the B2B portal that agents use, and the admin panel that the agency team uses. It covers flights, hotels, cars, tours, visas and transfers. Payments run in test mode, so no real money is charged. Our testing will focus on the main booking features and on how stable the system is.

Purpose

- Check that the main customer, agent and admin features work as expected.
- Check that prices, markups and totals are correct from search to confirmation.
- Find UI, functional and performance problems and report them clearly.
- Check the booking and payment (test mode) flows from start to end.

Test Objectives

- Make sure the main features (demo access, login, search, booking, payment) work correctly.
- Check that the website meets both functional and non-functional needs, such as speed, language and screen size.
- Log every bug in Jira and follow it until it is closed.
- Build an automation project that can be re-run to test the main flows again.

Scope

In scope:

- Demo access form.
- Login for storefront, B2B portal and admin panel.
- Flight search, filters, fare rules and booking.
- Hotel, car, tour, visa and transfer search and booking.
- Prices, markups and payments (test mode).
- Admin bookings, suppliers and reports.
- English and Arabic, dark and light theme, menus and links.

Interfaces and workflows:

- UI testing through the web interface.

- Main workflow: search, select a fare or room, passenger details, payment (test mode), confirmation.
- Supplier connection: live supplier data in test mode (it can change, which we note as a risk).

Out of scope:

- Real payments.
- Mobile apps.
- API testing of PHPTRAVELS (we do API testing on a different project).
- Database testing (we learn it in the course, but we do not apply it here).
- The product source code.

Testing Types

Type	Description
Manual testing	Functional, exploratory and usability testing. We write test cases in Excel and upload them to Jira.
Automation testing	Automate the smoke and regression cases for login, flight search and booking using Java, Selenium, TestNG and Cucumber (BDD) with the Page Object Model.
Performance testing	Simple load and response time checks with JMeter, kept light because the demo is shared.
Compatibility and localization	Check Chrome, Firefox, Edge and mobile screen sizes, plus English and Arabic (right-to-left).

Testing Strategy

Responsibilities:

- Test team: write and run the test cases, automate them, and report bugs.
- Developers (vendor): fix the bugs. As this is a demo, we report them but we do not control the fixes.
- Team leader (Bavly): follow the progress, run the daily meeting and keep Jira updated.

Test assumptions:

- The demo site is stable and available when we test.
- The modules shown on the demo page really work.
- We use dummy data only for users, passengers and orders.
- We have internet and the browsers we need.

Data approach:

- We create the test data ourselves.
- Functional testing uses dummy names, emails and test payment data.
- We use valid and invalid inputs to cover positive and negative cases.
- No real or private data is used.

Test Environment

Item	Details
URL	https://phptravels.com/demo
Browsers	Chrome, Microsoft Edge, Firefox
Automation tools	Java, Selenium WebDriver, TestNG, Cucumber
Performance tool	JMeter
CI and source control	Jenkins and GitHub
Test management	Jira, and Excel for test cases and bug reports
Operating system	Team laptops (Windows)

Test Data

Data type	Example
User accounts	Storefront, B2B and admin logins that the demo gives us after we fill in the form
Flight search	Cairo (CAI) to Dubai (DXB), one-way and round-trip, 1 to 3 adults
Hotel search	Dubai, 2 guests, 3 nights
Passengers	Dummy names such as Ahmed Hassan, with a test email address
Payment	Test mode only, with valid and invalid test payment data
Language	English and Arabic

Levels of Testing

Functional testing - features to be tested:

- Demo access, login, logout and sessions for the three user types.
- Flight, hotel, car, tour, visa and transfer search, filters and sorting.
- Fare rules on flight results.
- Booking flow: details entry, payment in test mode, confirmation.
- Markups set in the admin panel and how they change the prices.
- Admin dashboard: bookings, customers, suppliers and reports.
- Email messages for the demo logins and booking confirmations.

Regression testing - features to be tested:

- Login still works after the site is updated.
- Search and booking still work for flights and hotels.
- Prices and totals stay correct after changes.
- Filters, sorting and links still work.

Non-functional testing:

- Performance: page load time and search response time with JMeter.
- Compatibility: browsers and screen sizes.
- Localization: Arabic layout (right-to-left) and text.
- Basic security: bad input in forms, HTTPS, and login protection.

Execution Strategy - Entry Criteria

- The demo site is available and the demo logins are ready.
- The test plan is approved and the test cases are reviewed.
- Test data is ready.
- The tools (Selenium, JMeter, Jenkins, Jira) are installed and working.
- If something is missing, we check the risk and decide whether to start or wait.

Execution Strategy - Exit Criteria

- All planned test cases are executed.
- At least 90% of the test cases pass.
- No Critical or High bug stays open.
- Medium and Low bugs are logged and listed for a later release.
- All results, screenshots and reports are saved.
- The test completion report is finished.

Suspension criteria (we stop testing if):

- The demo site is down for more than 4 hours.
- Nobody can log in or search.
- More than 30% of the smoke tests fail.

Validation and Defect Management

- Testers run all test cases in each cycle and write the actual results.
- We track bugs in Jira, using the bug report sheet.
- The tester opens the bug, retests it after the fix, and closes it.

Timeline and Milestones

- Sprint 1 (Planning): test plan, project roadmap, entry and exit criteria.
- Sprint 2 (Analysis and Design): exploratory testing, test cases, Jira, first feature file.

- Sprint 3 (Implementation): GitHub project, JMeter scripts, Postman setup.
- Sprint 4 (Test Completion and Execution): run all tests, Jenkins pipeline, final reports.
- Every day: a short meeting. At the end of each sprint: a retrospective.

Severity

Severity	Impact
Critical	The system or a core function fails and the user cannot continue. Examples: a flight booking cannot be completed, login does not work, or a server error (500) appears on the main pages.
High	A major feature does not work properly, but the system can still be used in part. Examples: wrong total price, fare rules not showing, a markup not applied, or no confirmation after payment.
Medium	A smaller problem that does not stop the main use. Examples: a filter or sort gives the wrong order, the Arabic layout overlaps, or a slow page.
Low	A cosmetic issue with almost no business impact. Examples: a typo, a small color difference, or a button label that is cut off (such as the live chat label).

Dependencies

- The demo site is available and the demo logins keep working.
- Supplier data in test mode returns results.
- The payment sandbox works.
- Emails arrive on time.
- The vendor fixes bugs so that we can retest (if they do).

Risk Management

- **Risks:** the demo goes down, the data is reset or changed by other users, supplier data changes, the logins expire.
- **Mitigation:** use our own test data, try different routes and dates, ask for new logins when needed, and keep notes for every run.
- **Contingency:** re-run failed cases later, and use manual testing when automation is blocked by the chat widget or a captcha.

Test Deliverables

- **1. Test plan** - objectives, scope, testing types, environment, schedule and roles.

- **2. Test scenarios** - demo access, login, flight search, hotel search, booking, payment, admin bookings, language.
- **3. Test cases** - ID, title, preconditions, steps, test data, expected result, actual result, status and priority.
- **4. Test data** - logins, routes, dates, passengers and test payment data.
- **5. Bug report** - ID, title, description, steps, expected and actual result, severity, priority, status, reporter, assigned to and environment.
- **6. Automation project** - Java, Selenium, TestNG and Cucumber code on GitHub, with a user guide.
- **7. JMeter scripts** and the **Jenkins pipeline**.
- **8. Test execution report** - how many test cases ran, passed, failed or were blocked.
- **9. Test summary report** - bugs found, pass and fail numbers, and our notes.

Team

Business Area	Testers
Travel Booking / Online Travel Platform	• Bavly Romny Nabih (Leader) • Youssef Sherif Ibrahim • Ahmed Wael Hamed • Menna Mohamed • Abanob Hany Fahiem • Zeyad Ahmed Sabry
